

NATTAPON SOPONTANAPAT

Junior Full-Stack Developer

Phetchabun, Thailand • 091-0303399 • chopchat.dev@gmail.com • [GitHub](#) • [LinkedIn](#)

SUMMARY

Self-taught Full-Stack Developer specializing in TypeScript-first, production-grade web applications with Next.js and the PERN stack. Shipped four end-to-end platforms — a B2B procurement system, EV catalog CMS, e-commerce marketplace, and a multi-tenant B2B help desk SaaS — each enforcing strict type safety, automated CI/CD, and role-based access control from day one.

Bring a rare combination of business operations experience and AI-augmented development workflows (Claude Code, multi-agent pipelines, prompt engineering) that accelerate delivery without sacrificing architecture quality. Passionate about clean code, observability, and building systems that are maintainable long after launch.

TECHNICAL SKILLS

AI & Agentic Workflows: Claude Code, AI Coding Agents (Subagents), Workflow Automation, Prompt Engineering.

Languages: JavaScript (ES6+), TypeScript, SQL, HTML5, CSS3.

Frontend Development: React.js (Vite), Next.js (App Router), Tailwind CSS, Zustand, Responsive Design, Framer Motion, Radix UI.

Backend & Database: Node.js, Express.js, RESTful APIs, PostgreSQL, Supabase, Prisma ORM, Redis (Upstash), Stripe, Cloudinary.

DevOps, Testing & Tools: Git, GitHub, Postman, Vercel, Render, Docker (Multi-stage build), GitHub Actions (CI/CD), Playwright & Vitest (Testing), Sentry, Upstash QStash.

Security & Architecture: RBAC (Role-Based Access Control), Multi-Tenant Isolation, Zod (Data Validation), Clean Architecture.

PROJECTS

B2B Wholesale & Supply Chain Platform [\[GitHub\]](#) · [\[Live Demo\]](#)

Tech Stack: Next.js 16.2 (App Router), TypeScript (Strict), Prisma 7, Supabase (PostgreSQL & Auth), Tailwind CSS v4, Zustand, Zod, Sentry, Vercel, GitHub Actions.

Description: Engineered an enterprise-grade B2B procurement platform covering the full supply chain lifecycle — purchase orders, multi-role fulfillment, supplier coordination, invoicing, and analytics — with zero runtime type errors in production.

- **End-to-End Type Safety:** Enforced strict TypeScript across the entire stack with Prisma 7 schema-first access; a consistent { data, error } response contract eliminated an entire class of runtime bugs before QA.
- **Automated CI/CD Pipeline:** Built a 4-stage GitHub Actions workflow (Lint → Typecheck → Test → Build) blocking 100% of failing merges; Playwright E2E suite covers ~15+ critical flows including auth, checkout, and the full order lifecycle.
- **Production Observability:** Integrated Sentry with source-map uploads, session replay, and edge instrumentation — stack traces resolve to original TypeScript, cutting mean time-to-resolution significantly.
- **Normalized Relational Schema:** Designed a 5-entity data model (User → Order → OrderItem → Product → Merchant) with a 4-stage order lifecycle, maintaining full auditability and preventing data inconsistency at scale.
- **Multi-Role RBAC:** Architected Customer, Merchant, and Admin roles secured at the server-action level — all API routes enforce server-side validation with no client-side trust assumptions.

Helpwise — Multi-Tenant B2B Help Desk SaaS [\[GitHub\]](#) · [\[Live: gethelpwise.xyz\]](#)

Tech Stack: Next.js 16.2 (App Router), TypeScript (Strict), Prisma 7, PostgreSQL/Supabase, Redis (Upstash), Upstash QStash, Stripe, Claude API (Haiku), Tailwind v4, Vitest, Vercel.

Description: Architected a production multi-tenant help desk SaaS with subdomain-per-tenant isolation, two separate audiences (agent workspace + customer portal), AI-assisted triage, and business-hours SLA tracking — live with two explorable demo workspaces.

- **Multi-Tenant Isolation:** Subdomain → tenant resolution at the edge with Redis-cached lookups, enforced via a Prisma client extension that auto-injects tenantId into every query; PostgreSQL RLS scaffolded as a documented DB-level backstop.
- **Dual-Audience Auth:** Separated agent (requireAgent) and customer (requireContact) guards with distinct JWT audiences and cookies, guaranteeing internal notes never leak to the customer portal (enforced at query level, not UI).
- **Concurrency-Safe Ticketing:** Atomic per-tenant ticket numbering via row-locked counter increments; idempotent outbound email using conditional-updateMany claims to eliminate TOCTOU double-sends under queue retries.
- **Serverless Async Processing:** Signature-verified, fail-closed QStash worker routes for outbound email and SLA-breach sweeps — chosen over BullMQ because Vercel has no long-running worker.
- **Safe AI Integration:** Tool-free, tenant-scoped Claude calls with fail-closed rate limiting to minimize prompt-injection blast radius.
- **Idempotent Stripe Billing:** Signature-verified webhooks with a unique-event ledger (claim-first, reprocess-on-failure); money stored as integer minor units.

EV Car Catalog & Admin Dashboard [\[GitHub\]](#) · [\[Live Demo\]](#)

Tech Stack: Next.js 15, Prisma ORM, Supabase (PostgreSQL & Storage), Zod, Tailwind CSS, Docker.

Description: Designed and shipped a production-ready B2B EV car catalog with a secure CMS — containerized with a hardened multi-stage Docker setup and deployed to Vercel with zero-downtime releases.

- **Robust Security:** Implemented Role-Based Access Control (RBAC) to secure API routes and Server Actions, alongside strict data validation using Zod.
- **Clean Architecture:** Separated business logic and third-party services (e.g., Supabase Storage) into isolated helper functions for high maintainability.
- **Fail-Safe Storage Transactions:** Implemented orphaned-file rollback logic inside try/catch blocks, preventing cloud storage leaks during failed database writes — a production-grade pattern rarely seen in junior portfolios.
- **Containerized Deployment:** Multi-stage Docker build with non-root user execution and optimized image layers; production hardening that goes beyond basic containerization.
- **AI-Augmented Development:** Leveraged Claude Code for architectural reviews and component refactoring — accelerating delivery while enforcing consistent clean architecture across the codebase.

E-Commerce Marketplace Platform [\[GitHub\]](#) · [\[Live Demo\]](#) · [\[API Docs\]](#)

Tech Stack: React (Vite), Node.js, Express.js, PostgreSQL, Prisma ORM, Cloudinary, Stripe, Zustand, Zod, Tailwind CSS.

Description: Built a full-stack B2C e-commerce platform with a decoupled client/server architecture — demonstrating RESTful API design distinct from Next.js Server Actions, supporting the complete shopping lifecycle from discovery to payment.

- **RESTful API Architecture:** Structured Express.js backend with separated controllers, routes, and middleware layers — demonstrates architectural versatility beyond the Next.js monorepo pattern.
- **Live Stripe Integration:** End-to-end payment flow with Stripe including webhook handling and order confirmation — tested end-to-end, not a UI mock.
- **Full Back-Office System:** Admin dashboard covering 4 management modules (product, category, order, user) with RBAC in a single deployable system.
- **Data Integrity:** Designed relational database schema (User → Cart → Order → Product) with Prisma ORM to maintain accurate order history and prevent data inconsistency.
- **Multi-Service Production Deployment:** Frontend on Vercel, backend on Render, media on Cloudinary — a real distributed deployment, not a local demo.

WORK EXPERIENCE

Family Business Operation (Freelance / Manager)

2022 – Present

- Managed daily operations, procurement, and financial records for a heavy vehicle parts business — experience that shaped a data-driven approach to inventory systems and an understanding of real-world supply chain workflows that directly informed the B2B platform project.

Internship Trainee (F&B) | Various Hotels (Grand Mercure, Avani)

2020 – 2021

- Collaborated with the team to ensure high standards of customer service.
- Developed strong communication and time management skills under pressure.

EDUCATION

Bachelor of Business Administration (B.B.A.), International Program

Graduated 2022

- Assumption University (ABAC) | Bangkok, Thailand.

Independent Study & Professional Development

Oct 2024 – Present

- Full-Stack Development: intensive self-directed study covering the PERN stack, Next.js App Router, Docker, System Architecture, and Security best practices.
- Continuous Learning: active contributor on GitHub with 519 contributions in the last year.

ADDITIONAL INFORMATION

Languages: Thai (Native), English (Intermediate).

Key Strengths: Strong self-discipline (self-taught developer), business-oriented mindset, and adaptability.

Interests: Keeping up-to-date with AI technologies, Web Architecture, and System Design.
